# TECHNICAL OVERVIEW

- Protect multiple SharePoint environments – whether hosted on premises, a hybrid deployment, or on cloud platforms such as Microsoft Office 365, OneDrive for Business, and VMs – to centrally manage SLAs across SharePoint assets from a single interface
- Fast backup and restore of entire SharePoint farms or selective components, including back-end Microsoft SQL Server databases with all configurations, Index/Job/Search/FAST servers, front-end IIS settings, file system resources, third-party or custom application databases, stub databases, BLOB stores, and entire VMs, with robust VSS, VDI, or advanced NetApp snapshot technology
- Full-fidelity backup and granular restore of all SharePoint content, including web applications, site collections, sites, apps, Recycle Bins, lists, libraries, items, workflow definitions and instances, configurations, permissions, metadata, and version histories with SharePoint API technology
- Full, incremental, and differential backup capabilities enable backup plans and schedules to focus on frequent backup of high-priority or failed data from previous jobs, improving backup operations, and storage efficiency
- Preview and double-check backup documents before performing a document restore to ensure accuracy
- Perform fast, granular restores of SharePoint content and components, including databases, site collections, apps, Recycle Bins, sites, lists/libraries, items, security, properties, service applications, solutions, as well as other custom objects through DocAve or directly through SharePoint via end-user restore of web parts
- Easily recover entire SharePoint environments with the Farm Rebuild Wizard by restoring externalized BLOB data, SQL Server databases, and Index servers with step-by-step guidance, or simply restoring the SharePoint server VMs and SQL Server databases to original SharePoint and SQL Servers
- Clone source SharePoint environments with the complete data from VMs, farms, WFE servers, web application servers, and SQL Server databases to a destination environment in order to easily build a full-order testing-staging-production SharePoint system
- Repair one or multiple SharePoint servers within the specified farm with a one-click fix capability to reduce response time when system errors occur – such as failing to open the Central Administration page
- Rapidly restore SharePoint content with AvePoint's InstaMount technology, enabling fast recovery of individual items to the production environment from a full database backup without first staging the database
- Reduce data recovery time to minutes by generating persistent backup snapshots using advanced NetApp technology, and granularly restore from hardware-based snapshots to achieve robust RPOs and RTOs
- Backup to the most commonly used storage platforms including Net Share, FTP, Amazon S3, AT&T Synaptic, Box, Caringo Storage, Cleversafe, DELL DX Storage, Dropbox, EMC Atmos, EMC Centera, Google Drive, HDS Hitachi Content Platform, IBM Storwize Family, NetApp Data ONTAP, OneDrive, Rackspace Cloud File, TSM, and Microsoft Azure Storage
- View all web applications, site collections, or sites that have been backed up through a comprehensive, centralized dashboard

## Quickly create platform or granular backup and restore plans with DocAve's easy-to-use wizard.
